|--|--------|------|-----------------|-----|
| FASTING: UNKNOWN | | | | |
| CANDIDA ALBICANS AB (IGG,IGA,IGM) | | | | |
| C.ALBICANS IGG | 0.1 | | | XE |
| C.ALBICANS IGA | <0.1 | | | XE |
| C.ALBICANS IGM | 0.1 | | | XE |

REFERENCE RANGE: <1.0

INTERPRETIVE CRITERIA:

- <1.0 Antibody not detected
- > or = 1.0 Antibody detected

Systemic candidiasis is often characterized by markedly elevated levels of IgG, IgA, and IgM recognizing Candida. However, interpretation of Candida antibody levels is complicated by detection of antibodies in 20-30% of healthy individuals, and blunted antibody responses in immunocompromised patients at risk for systemic candidiasis. Candida antibody results should be considered within the context of clinical findings and results from other relevant laboratory tests, such as Candida antigen detection and/or culture.
